

IN THE SPECIFICATION:

Please replace the paragraph spanning pages 2-3 with the following replacement paragraph:

The invention also relates to a method for providing a packet-switched network user with a service via the intelligent network, in which method a Packet Data Protocol (PDP) context is activated to convey data packets, and which method is characterized by forming a PDP context control record, by which the event management of the PDP context is controlled, which control record can be modelled by a state model and which has a functional connection to at least one service control function of the intelligent network, and by defining at least one of the PDP context events as an intelligent network event to the control record, which event causes the use of intelligent network control principles.
